

How to create inner text links

One of the most requested features I was asked to include is to enable inner-linking between content areas of sections of this template. An example is if you wanted to have a text link within your About Us copy that would link to your contact page or a gallery or any other module – this is now supported.

Like in the screenshot above, those links in that page will take you to those sections in this template. Now let's learn how do to integrate that in your site.

This will work anywhere inside of any text in your XML files. This goes for all text modules, descriptions for image and video modules, etc.

This example is showing about.xml

Here's the code to load the traditional gallery:

```
<a href="asfunction:_root.catchLink,gallery-traditional,gallery-traditional/gallery1/main.swf">View our image gallery</a>
```

Let's break this apart.

It looks like a lot, but it's very simple.

You create your basic `My link name<a>`

And add `<a href="asfunction:_root.catchLink"`

`asfunction` – this is telling Flash that this link is for a function stored in Flash, otherwise it would try to open a URL.

`_root.catchLink` is a function stored at the root of the template that figures out what your trying to link to.

```
<a href="asfunction:_root.catchLink,gallery-traditional,gallery-traditional/gallery1/main.swf">View our image gallery</a>
```

After `_root.catchLink` there is a comma that separate it from `gallery-traditional` – which is the module type that you would normally store in your `navigation.xml`.

After that, there is another comma that is the asset – `gallery-traditional/gallery1/main.swf` – that once again is what you would normally store in `navigation.xml`. Just think of this as if you were extending your navigation in the same way, but simply changing a bit about the syntax. ***Just be careful that there are no spaces around the commas.***

So to use this, just copy the code above and just change your module type, and your asset, and your good to go.

Here's some more examples:

Video Gallery

```
<a href="asfunction:_root.catchLink,gallery-video,gallery-video/gallery1/main.swf">View our videos</a>
```

Contact Us

```
<a href="asfunction:_root.catchLink,contact,">Contact Us</a>
```

Staff Module

```
<a href="asfunction:_root.catchLink,staff,staff/staff.swf">Staff</a>
```

Slideshow

```
<a href="asfunction:_root.catchLink,slideshow,slideshow/home.swf">My Slideshow</a>
```

Text

```
<a href="asfunction:_root.catchLink,text,text/services.xml">Services</a>
```

And so on...
